Software Engineering undergraduate (Class of 2028) who ships full-stack web apps in Next.js and Python, with an interest in applied statistical modelling. Placed 2nd regionally at National AI Hackathon for the detection methodology behind a shadow-economy scoring platform.

HONORS & AWARDS

- 2nd Place — National AI Hackathon (Umummilliy AI Xakaton)** · Qarshi, Uzbekistan August 2026
Awarded 20,000,000 UZS for Shadow Index, a shadow-economy detection platform designed and built over three days of competition.
- Gold medal – National stage of AIMO (Asia International Math Olympiad)** August 2021
- Gold medal – National stage of PIMSO (Philippine International Math and Science Olympiad)** May 2021

EDUCATION

- New Uzbekistan University** · B.Sc. Software Engineering 2024 – 2028
Coursework: Introduction to Programming, OOP (C++), Web Programming, Algorithms & Data Structures (C++), Linear Algebra, Discrete Mathematics, Calculus I–II, Computer Architecture (NASM), Probability & Statistics.
- Presidential School in Karshi** 2021 – 2024
Cambridge A Level: **Mathematics 83/100 (A)** · **Physics 83/100 (A)** · **Computer Science 65 (C)**.

PROJECTS

- Shadow Index** · methodology & research · [Visit](#) August 2026
- Took 2nd place regionally (20,000,000 UZS prize) by designing, in three days, the methodology behind a platform that scores how likely a business is to be operating in the shadow economy and explains every flag it raises.
 - Turned an officially unmeasurable problem into a working scoring model: a weight-of-evidence logistic scorecard — the family used in credit-risk underwriting — over seven forensic signals that cross-check a firm's own filings against each other, with confidence computed separately from probability so marginal evidence never reads as certainty.
 - Kept the AI layer accountable by confining the language model to schema-constrained narrative synthesis, structurally preventing it from altering any number the deterministic layers produce.
- Math Homework & Testing Platform** · Next.js, PostgreSQL, Prisma, Tailwind, Vercel · [GitHub](#) 2026
- Built and deployed a live auto-graded testing platform for a maths teacher: teachers create classes and multiple-choice tests, assign them by shareable link, and students take them by student ID with no account or password.
 - Protected result integrity by grading server-side so answers never reach the browser, and by enforcing one attempt per student ID; teachers get a dashboard with scores per student and accuracy per question.

TRAINING

- MAAB Innovation** · Python & SQL Server programme Feb – Jun 2025
- **Python:** fundamentals, OOP, data manipulation with pandas, web scraping and APIs.
 - **SQL Server (SSMS):** core concepts, aggregation and joins, advanced queries, window functions, views and stored procedures.

TECHNICAL SKILLS

Languages: Python, TypeScript/JavaScript, SQL (T-SQL, PostgreSQL), C++, C#/.NET.

Tools & libraries: Next.js, React, Prisma, Tailwind CSS, pandas, PostgreSQL (Neon), SQL Server (SSMS), Vercel, Git & GitHub.

Methods: OOP, algorithms & data structures, probability & statistics, weight-of-evidence / logistic scorecards, schema-constrained LLM output, web scraping & APIs.
